Annual Medicare Program Statistics

The Health Care Financing Administration (HCFA) is responsible for the Medicare program and Federal participation in State-operated Medicaid plans. HCFA's mission is to finance "...the timely and economic delivery of appropriate health care to eligible beneficiaries." HCFA reimbursement policies have significant and far-reaching effects on providers, beneficiaries, and payers. Understanding these effects and their causes is essential to the planning and implementation of cost-saving initiatives.

Within HCFA, the Bureau of Data Management and Strategy (BDMS) is responsible for the development of systems and computer programs to establish and maintain the national Medicare statistical files. BDMS develops and coordinates agency statistical methods for the economic analysis of health care financing issues and proposals.

This *Annual Medicare Program Statistics* report contains data on Medicare utilization. The data can be useful to health care managers, planners, and researchers, particularly for those examining cost-saving alternatives for health care delivery methods, such as capitation.

I. Trends

Medicare utilization

Medicare utilization data provide information on the aged and disabled populations using services covered by the hospital insurance (HI) and supplementary medical insurance (SMI) programs.

This report presents data on persons served and type of services used by the enrolled population in 1984. Changes in utilization over the years are highlighted and presented in the text tables. Data on persons served include experience only for persons who exceeded annual deductibles, and for whom bills were submitted that resulted in reimbursement.

All persons

- In 1984, 20.7 million persons used Medicare services, an increase of one million over the number receiving reimbursed services in 1983. The number of those persons who received reimbursed services in 1984 has increased 190 percent since 1967--the first full year of Medicare.
- Over two-thirds (68.1 percent) of persons eligible on July 1 received reimbursed services in 1984. This figure has increased from 1967, when just over one-third (36.6 percent) of eligible persons received reimbursed services.
(The SMI deductible was \$50 annually from 1966 through 1972, \$60 from 1973 through 1981, and \$75 since 1982. These relatively fixed SMI deductibles coupled with rapidly increasing approved charges for SMI services accounted for most of the increase in the percentage of persons exceeding the deductible, and therefore, receiving reimbursement.)
- Almost 6.9 million persons had one or more hospitalizations in 1984, a rate of 229 persons per 1,000 enrollees. Persons reimbursed for inpatient hospital services decreased about four percent between 1983, when most hospitals were still reimbursed under the reasonable cost method and 1984, the year most hospitals transitioned into the prospective payment system.
- Physicians' services were used by 19.8 million persons in 1984. These persons represent 95.7 percent of persons with reimbursable services and two-thirds of persons enrolled for SMI. (Additional persons used physicians' services but did not exceed the deductible or submit bills, and thus are not reflected as persons served in these data.)
- Considerably more persons received home health agency (HHA) services under HI (1.5 million) than under SMI (24 thousand). Persons receiving HHA services increased 13.8 percent between 1983 and 1984. Home health services under HI show an annual percent increase of 14.9 percent since the program began, considerably higher than the other services shown.

Aged Persons

- Persons 65 years of age and over represented 90.5 percent of Medicare enrollees and 91.1 percent of persons served in 1984.
- Almost 27.6 million aged persons were enrolled in 1984. Aged enrollment has shown an average annual percentage increase of approximately 2 percent since 1967.

- The proportions of aged persons receiving services were larger for successively older age groups. In 1984, 64.2 percent of persons 65-74 years of age, 73.6 percent of persons 75-84 years of age, and 78.1 percent of persons 85 years of age and over used services.
- A higher proportion of aged females (70.9 percent) used covered services than did males (65.1 percent) in 1984. Use rates have increased for aged persons of both sexes since the program started. Higher rates for females have been a consistent trend.
- Proportionately more white persons (69.2 percent) than persons of other races (63.6 percent) used services in 1984. This difference is also consistent with previous years.
- One exception to the general age-, race-, and sex-use patterns for the elderly occur for inpatient hospital care. In 1984, a higher proportion of aged males (23.8 percent) experienced hospitalizations than did aged females (22.2 percent).
- The number of aged persons receiving inpatient hospital services per 1,000 enrolled decreased 5.4 percent between 1983 and 1984. All census regions experienced decreases during this period.
- Rates of aged persons served per 1,000 enrollees in 1984 were considerably higher in the Northeast (729) and West (705), than in the North Central (682) and South (676).
- Among the States in 1984, the rate of aged persons served per 1,000 enrolled ranged from 596 in Louisiana to 804 in Rhode Island.
- A significant number of bills for Massachusetts were not available for processing at the time this report was prepared. Therefore, data for Massachusetts are understated. This also effects the division and national totals to a lesser degree.

Disabled Persons

- Disabled persons accounted for 9.5 percent of Medicare enrollees and 8.9 percent of persons served in 1984.
- The number of disabled persons peaked at almost 3 million in 1981. Since then the number has decreased over one percent each year through 1984.
- The numbers of persons served per 1,000 disabled enrollees were higher of successively older age groups. Persons used rates ranged from 565 per 1,000 persons under age 35 years of age to 700 per 1,000 persons 60-64 years of age.
- A higher proportion of disabled females (73.1 percent) than males (58.7 percent) used Medicare services in 1984. Persons served rates have increased for both sexes since Medicare began coverage for the disabled in 1973, but females have consistently had higher use rates.
- Disabled white persons had a slightly higher percent of persons served (64.0 percent) than did persons of other races (63.8 percent).
- In the Northeast, 691 per 1,000 disabled persons used Medicare services in 1984. In the South, the rate was 624 per 1,000 disabled enrollees. North Central and West rates fell between these high and low rates.
- States varied widely in the rates of disabled persons served in 1984. The highest rate of persons served was in Michigan (730 per 1,000 disabled), the lowest in Alaska (534 per 1,000 disabled).

III. Definitions

Program related terms

Aged beneficiaries—Persons 65 years of age or over entitled to monthly Social Security Administration (SSA) benefits or payments from the Railroad Retirement Board (RRB), persons uninsured for SSA or RRB benefits but transitionally insured for Medicare, and persons 65 years of age or over not included in the above groups who purchase HI and SMI coverage. Included are persons 65 years of age or over identified as having end stage renal disease (ESRD).

Disabled beneficiaries—Persons under 65 years of age entitled to SSA disability benefits for at least 24 months, including those receiving SSA disability benefits and identified as having ESRD, and those deemed disabled solely because of ESRD. Disability beneficiaries are further classified according to the type of disability entitlement under SSA, that is, disabled workers, adults disabled as children, and disabled widows and widowers.

Change in benefit status—When disabled beneficiaries attain age 65 they are reclassified as aged persons. Persons changing benefit status during the year may be counted in both the disabled and aged categories.

Type of coverage—Medicare provides two basic types of insurance: a hospital insurance (HI) plan and a voluntary supplementary medical insurance (SMI) plan. Most aged persons may be covered by either one or both plans. However, those aged persons paying a premium for HI coverage must also enroll for SMI coverage. Disabled persons may not enroll for SMI coverage without HI coverage, except in circumstances where entitlement was awarded through Government error that warranted equitable relief.

Mid-point enrollment—Enrollment as of July 1 has been chosen as the denominator for utilization rates published in this Medicare data series. The choice was based on the similarity of the July 1 enrollment to a 12-month average enrollment.

Persons ever enrolled—Persons eligible for benefits at any time during a calendar year. (See, also, Change in benefit status.)

Persons served—Persons are counted once for each type of covered service used, but are not double counted in aggregate totals. Thus, a person who receives inpatient hospital services and skilled nursing facility services in a year is counted as receiving both of these services, but is counted only once in the all persons served under HI. A person receiving the same service two or more times in a year is counted as one person served. For example, persons

having two or more hospitalizations during a year would be counted as one person served for inpatient hospital services. In a like manner, persons served under both HI and SMI are counted only once in the overall total (that is, hospital insurance and/or supplementary medical insurance). (See, also, Change in benefit status.)

Medicare utilization—Data reflect services furnished in 1984. The tabulations include bills received and recorded in HCFA central office records through December 1985. Data are reported by the residence of the beneficiary as indicated on the earliest dated bill in that year. Utilization data are unavailable for beneficiaries enrolled and receiving services from health maintenance organizations where no bill is submitted to the intermediary.

Geographic classifications

All areas—Consists of the United States, Guam, Puerto Rico, Virgin Islands, other outlying areas, and foreign countries.

All other areas—Consists of American Samoa, Canton Island, Caroline Islands, Guam, Northern Mariana Islands, Marshall Islands, Midway Islands, Virgin Islands, and Wake Islands.

State unknown—There were 19,000 aged and 3,000 disabled persons with unknown State of residence recorded in the master enrollment record file in 1984. Most of these entries for the aged were the result of processing errors of codes for State or foreign countries. Most of the unknown State of residence records for the disabled were incomplete temporary enrollment records established for persons with end stage renal disease.

United States—Consists of the 50 States, the District of Columbia, and residence unknown.

Demographic classifications

Age—Ages for all persons alive at the end of a year are calculated as of July 1 of that year. For persons dying during the year, ages are calculated as of the first day of the month of death.

Race—Categories include white and all other races as entered into the master enrollment record file from basic records completed by the beneficiary. On July 1, 1984, the number of aged HI beneficiaries without a race designation was more than 792,000. There were 56,000 disabled persons (primarily RRB beneficiaries) whose race was not known. The relatively high proportion of RRB beneficiaries without a race designation is because of incomplete data exchange procedures.

Sex—As recorded in the master enrollment record file.

IV. Appendix

Sampling method and reliability of estimates

Data in the utilization section are based on bills (the statistical records for the claims submitted by most institutional providers) and payment records (the statistical records for claims of physicians and noninstitutional providers) for a 5-percent sample of enrollees 65 years of age or over and a 25-percent sample of disabled enrollees. Samples are selected on the basis of the enrollee's health insurance number. Because this number appears on every claim, all bills and payment records for an individual can be summarized by type of benefit into an individual record. Sample counts are multiplied by 20 (aged) or by 4 (disabled) to obtain the Medicare population estimates shown in the tables.

Because the estimates are derived from a sample, they may differ from estimates derived from other possible samples of the same size and design. The difference between a sample estimate and the average of estimates from all possible samples is called the sampling error. The standard error of a sample estimate is a measure of the variation among the estimates from all possible samples. It is also a measure of the precision with which an estimate from a particular sample is likely to approximate the average estimate for all possible samples. Another measure of the variation among the estimates derived from possible samples is the relative standard error, which is defined as the standard error divided by the value being estimated.

The sample estimate and an estimate of its standard error may be used to construct an interval estimate that includes the average result of all possible samples with prescribed confidence. To illustrate, if all possible samples were selected under essentially the same conditions and an estimate and its estimated standard error were calculated for each sample, then:

- Approximately two-thirds of the intervals from one standard error below the estimate to one standard error above the estimate would include the average value of all possible samples. This interval is called a two-thirds confidence interval.
- Approximately nineteen-twentieths of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average value of all possible samples. This interval is called a 95-percent confidence interval.
- Almost all intervals from three standard errors below the sample estimate to three standard errors above the sample estimate would include the average value of all possible samples. Thus, for a particular sample, one can say with specified confidence that the average of the estimates from all possible samples is included in the constructed interval.

In the formulas used to derive estimates of standard errors, a number of approximations were made. As a result, the tables presented provide an approximation of the exact standard error for any specified item.

Number of persons

Tables 1 and 2 contain approximate standard errors for estimates of the number of persons using (and, conversely, not using) specific types of reimbursed services for the aged and disabled, respectively.

For example, to estimate the standard error associated with an estimate of 5,000 aged persons using services in Table 1, an approximate two-thirds confidence interval can be constructed by adding and subtracting 308 (one standard error) to the estimate of 5,000. Thus, the confidence interval ranges from 4,692 to 5,308. An approximate 95-percent confidence interval can be constructed by adding and subtracting 616 (twice the standard error) to the estimate of 5,000. Thus, this confidence interval ranges from 4,382 to 5,616. In a similar fashion, an approximate "99 percent plus" confidence interval can be constructed by adding and subtracting 924 (three times the standard error) to the estimate of 5,000. To estimate approximate standard errors of estimates not presented directly in the tables, linear interpolation may be used.

Tables 3 and 4 present the approximate standard errors of the estimated number of persons served per 1,000 enrolled. Double linear interpolation may be needed because both the number of persons enrolled (in thousands) and the estimated number of persons receiving reimbursed services per 1,000 enrolled may require interpolation. A more accurate approximation of the standard error can be computed by dividing the standard error of the estimated number of persons served (determined from the formula) by the number persons enrolled, expressed in thousands. As an example, in a theoretical situation where the estimated number of aged persons served per 1,000 hospital insurance (HI) enrollees is 100 and the base HI population (as of July 1) is 50,000, the estimated number of persons served is 5,000 (100 persons served per 1,000 enrollees times 50). The standard error of persons served (determined by the formula) is 308. Therefore, the standard error of the number of persons served per 1,000 enrollees is about 6 (308 divided by 50). Various intervals of prescribed confidence can be constructed for the rate per 1,000 enrollees, as described earlier, using one, two, or three times the standard error.
